1610-3 FUNCTIONAL SPECIFICATION		SHEET	3	OF	

1. SCOPE

This specification defines the design requirements for the Shugart 1610-3 Rigid Disk Controller.

## 2. APPLICABLE DOCUMENTS

All relevant Engineering Specifications.

Small Computer Systems Interface (ANSI X3T9.2) Specification ES600 Disk Drive Engineering Specification. ES700 Disk Drive Engineering Specification.

3. GENERAL DESCRIPTION

3.1 General Description.

The 1610-3 Controller is a microprocessor based rigid disk controller with three custom LSI chips (NMOS). The controller is capable of controlling two Winchester disk drives, ST506 interface compatible. The dimensions of the controller are in the "foot print" of the drives. The custom LSI circuitry is implemented in the Buffer controller chip, Disk controller chip, and Encode/Decode chip. The 1610-3 Controller is designed as a peripheral controller to be used with the low end of the SCSI industry standard interface as defined by the SCSI specification no. (ANSI X3T9.2).

3.2 Features.

- \* Support subset of SCSI commands on Host Adapter systems without Arbitration.
- \* Support two different disk drives of the same capacities.
- \* Up to 1-Mbytes/second maximum bus data transfer rate.
- \* 5-Mbits/second (ST506) Drive transfer rate.
- \* 1-KByte Dual Port data buffer.
- \* Asynchronous REQ/ACK Handshake for bus data transfer.
- \* Single Ended drivers/receivers.

- \* Removable bus terminations.
- \* Implied Seek for data transfer operations.
- \* 21-Bit logical block addressing.
- \* Automatic Cylinder/Head switching.
- \* Programmable sector interleaving.
- \* Jumper selectable block sizes (256, 512 bytes).
- \* Multiple block transfer.
- \* Automatic Read retries.
- \* Track level defect handling.
- \* 32-bit ECC polynomial for data field. Allows 11-bit burst error detection and 8-bit burst error correction.
- \* 16-bit CRC for ID field verification.
- \* Jumper selectable PULSE-MODE Selection.
- \* Power On Diagnostic.
- \* 20,000 hours MTBF

## 4. DISK DRIVE INTERFACE.

The drive interface is ST506 compatible. The control signals to and from the disk drives are transmitted via a daisy-chain cable at connector J2. Data and clock signals are transmitted differentially between the controller and the drives through the connectors J3 J4, and J5. Figure 4.1 shows the cable configuration between the controller and drives.

Figure 4.1 1610-3 Drive Cable Configuration.

4.1 Drive Control Signals.

J2 is a 34 pin, control signal, card edge connector. Maximum length should not exceed 20 feet (6 meters). Open collector

drivers are used for all transmitted signals. All assigned control signals are terminated with 220 ohms to +5 volts and 330 ohms to ground at the receiving end of the cable. These termination resistor to be provided by a removable resistor pack. The pin assignment of the J2 connector is shown in Table 4.1.

5. HOST BUS.

. . . . . .

The 1610-3 controller communicates with host systems through an interface bus derived from the Small Computer Systems Interface (SCSI). The controller is connected to the host bus via the 50 pin connector at J101. This cable length should not exceed 20 feet (6 meters) from the first to the last device on the bus.

5.1 Interface Signals.

Refer to SCSI Specification (ANSI X3T9.2) for detail description of bus signals.

Table 5.1 shows the pin description of the J101 connector.

TITLE 16	0-3 FUNCTIONAL SPECIFICATION SHEET 8 OF
	5.2 Interface Protocol.
	For detailed information regarding the Host Interface Protocol, refer to the SCSI Specification (ANSI X3T9.2)
	5.3 Cable Termination.
	All assigned signal lines are terminated with 220/330 ohm resistor packs at the controller side. These resistor packs are mounted on sockets to allow for removal if controller is used in the middle of the bus cable.
	5.4 Bus Device ID.
	The controller is allowed to assume any uniquely assigned SCS bus device address. This device address (from 0 to 7) can be selected through the jumpers CU4, CU2, CU1. Refer to diagram 6.1 for the location of these jumpers.
6.	CIRCUIT BOARD.
	The 1610-3 controller consists of a single 2-layer printed circuit board. Figure 6.1 shows the locations of the various cable connectors, removable terminators and option jumpers.
	6.1 Option Jumpers.
	6.1.1 CU4, CU2, CU1: This group of jumpers are used to set device address of the controller on the SCSI bus.
	6.1.2 Jumper W: This jumper is used to select the size or the sectors.
	J-W Bytes/Sec Sectors/Trk Out 256 32 In 512 17
	6.1.3 Jumpers X and Y: These jumpers are not used.
	6.1.4 Jumper Z: This jumper is used in conjunction with the Selection mode jumpers SX, SN and PS. This jumper should be installed if the PULSE MODE is selected. See sections 6.1.7 and 6.1.8.
	6 1 5 Jumpon 42.41. These positions if jumpered select

the Yardward Feset mode.	When a	SCSI H	ost devic	e	

issues a RESET on the bus, the microprocessor of the controller will be reset. This has the same effect as a power-on reset.

- 6.1.6 Jumper H2-S: These positions if jumpered select the Software Reset mode. The RESET signal from the host device is latched by the controller. The microprocessor, under program control, would perform a controller reset on the SCSI bus.
- 6.1.7 Jumper SX-NS: These positions if jumpered select the normal mode of SCSI bus device selection. During the selection phase, the host must continue to assert the SELECT signal until the controller responds with the BUSY signal. If this mode is selected, jumper Z must not be installed.
- 6.1.8 Jumper SX-PS: This jumper position allows the host adapter to select the controller by pulsing the SELECT line (PULSE MODE). The SELECT signal is latched by the controller allowing the microprocessor to detect that the host initiated selection. This enables the controller to respond to a host that issues short selection pulses. Jumper Z must be installed if this mode is selected.

7.6 Write Precompensation and Reduce Write Current.

The host can specify the cylinder number to start performing write precompansation and reduce write current through the Set Drive Parameter Command (Opcode OCh).

The controller automatically enables the write precomp circuitry and selects reduce write current mode on the drive at the specified cylinders. If the host does not specify these locations, the defaults at cylinder 128 for the reduce write current and cylinder 64 for the write precompensation.

## 8. CONTROLLER COMMAND DESCRIPTION

8.1 Command Block.

An Input/Output request to the 1610-3 is performed by passing a command descriptor block (CDB) to the controller. The CDB consists of six bytes sent by the host during the Command phase. The first byte of the CDB is the command group and operation code. The second to the fourth bytes specify such information as the logical unit number (LUN), and block starting address. The fifth byte specifies the number of blocks to transfer. The sixth byte is the Control Byte.

Refer to the SCSI specification (ANSI X3T9.2) for a detailed description of the structure of the command descriptor block.

8.1.1 Logical Unit Number.

The 1610-3 controller supports a maximum of two logical units. Therefore, the LUN field in the command can take on the value of 0 or 1 only.

TABLE 8.2.12.1: SET DRIVE PARAMETER COMMAND

The host specifies the disk parameters of the drives connected to the controlller by sending the SET DRIVE PARAMETER command. This should be done after power-on or a RESET to the controller. The drive parameters are sent to the controller during the DATA OUT phase of the command execution. The parameters are stored in the controller RAM.

The pararameters and characteristics of both drives connected to the controller are initialized when this command is issued. Therefore, if drives with different parameters are used, this / command must be sent to the controller each time when switching between drive.

The format of the drive parameter block is described in Table 8.2.12.2.

Table 8.2.12.2: Drive Parameter Format.

Byte-O:	Maximum number of Cylinders (MSB).
Byte-1:	Maximum number of Cylinders (LSB).
Byte-2:	Maximum number of Heads.
Byte-3:	Reduce Write Current Cylinder (MSB).
Byte-4:	Reduce Write Current Cylinder (LSB).
Byte-5:	Write Precompensation Cylinder (MSB).
Byte-6:	Write Precompensation Cylinder (LSB).
Byte-7:	Maximum ECC data burst length

The maximum number of cylinders and heads supported by the 1610-3 controller is defined in Section 7.1 of this document.

MACTICIAL SPECIFICATION		SHEET	27	OF	

8.2.14 Assign Alternate Track Command (OE)

TABLE 8.2.14.1: ASSIGN ALTERNATE TRACK COMMAND

Bit-7 Bit-6 Bit-5 Bit-4 Bit-3 Bit-2 Bit-1 Bit-0

Byte-0	0	0	0	0	0	1	1	1
1.5		- LUN		L0	GCIALB	LOCK AD	DR (MSB	)
			LOGIC	AL BLOC	K ADDRE	SS		
3			LOGIC	AL BLOC	K ADDRE	SS (LSB	)	
parte -4			IN	TERLEAV	E CODE-			
agr. 2-5	(*)	0	(*)	(*)	(*)	(*)	(*)	(*)

(\*) See description of the Control Byte in Section 8.1.

The ASSIGN ALTERNATE TRACK command allocates an alternate track (whose address is specified in a 3 byte field sent in the DATA OUT phase of the command) to the track specified by the logical block address in the CDB. The controller modifies the format of both the alternated and the alternate track by changing the ID fields of all sectors of those tracks.

Table 8.2.14.2 shows the format of the 3 byte field that is sent during the DATA OUT phase to specify the alternate track address

TABLE 8.2.14.2: ALTERNATE TRACK ADDRESS

Bit-7 Bit-6 Bit-5 Bit-4 Bit-3 Bit-2 Bit-1 Bit-0

Byte-D	Ũ	0	0 -	LOG	CIAL BLOO	K ADDR	(MSB)
1 NO 3-1			LOGICAL	BLOCK	ADDRESS-		
2			LOGICAL	. BLOCK	ADDRESS	(LSB)	

Attempts to access the logical block(s) of a track that is elternated causes the controller to access the blocks at the abjernate track. Attempts to access any sector in the alternate track directly causes a CHECK CONDITION status.

Alternate tracks cannot be allocated as alternated tracks to other alternate tracks. Only one level of assignment is allowed. A track cannot be alternated to itself.

The controller keeps track of the error statistics for each connected drive. This command causes the controller to return the 8 bytes of error statistics associated with the specific LUN during the DATA IN phase. The format of the error statistics returned is shown in Table 8.3.4.2.

The error log area is cleared after completing this command.

Table 8.3.4.2: Error Logout Data Format.

Non-recoverable Error Count (MSB).
Non-recoverable Error Count (LSB).
Recoverable Errors (MSB).
Recoverable Errors (LSB).
Soft ECC Errors (MSB).
Soft ECC Errors (LSB).
Correctable ECC Errors (MSB).
Correctable ECC Errors (LSB).

- Non-recoverable errors are errors that cannot be overcome after all retries, except unrecoverable ECC errors.
- Recoverable errors are ones that are overcome after one or more retries. This count excludes the recoverable ECC errors.
- Soft ECC errors are ECC errors that are detected on the first read operation which are then read with no errors during retry operations.
- Correctable ECC errors are errors that are correctable using the ECC correction scheme.

10-3 FUNCTIONAL SPECIFICATION SHEET 32 OF
8.4 Completion Status Byte.
When the 1610-3 controller completes a command, a byte of status is always sent to the host during the STATUS phase. This is used to indicate to the host if the command is completed successfully.
The format of the status byte is shown in Table 8.4.
Table 8.4.: Status Byte Format.
Bit-7 Bit-6 Bit-5 Bit-4 Bit-3 Bit-2 Bit-1 Bit-0 <lun> 0 0 0 ERROR 0</lun>
- Bit-1: ERROR; This bit is set if an error occured during command execution. The host may perform a REQUEST SENSE command (O3) to obtain more detailed information.
8.5 Sense Bytes Format.
The REQUEST SENSE command (03) returns a block of four bytes of sense information to the host. See Section 8.2.3.
The first byte of the sense data contains the following fields:
<ul> <li>Bit-7: ADDRESS VALID; If set, then bytes 01 through 03 of the sense data represent the address at which the error occurred.</li> </ul>
- Bit-4 to 6: CLASS; Specifies the error class.
- Bit-O to 3: ERROR CODE; Specifies the type of error.
8.5.1 Class O: Drive Error Codes.
HEX VALUE ( 0 ) No Sense. ( 1 ) No Index Signal From Drive Selected. ( 2 ) No Seek Complete. ( 3 ) Drive Fault. ( 4 ) Drive Not Ready. ( 5 ) Not Used. ( 6 ) No Track OC. ( 7 ) Not Used. ( 8 ) Seek In Progress. ( 9 - F ) Not Used.
